

Compressed Schedule: OpenClaw, Hermes, NanoClaw + Heartbeats, Skills, Channels, A2A

Window: 9:00 AM – 2:30 PM | **Lunch:** 12:00–
1:00 PM | **Net teaching time:** 4.5 hours

To fit the 7-part lesson into this window, labs are trimmed to single guided demos (instructor-led, learners follow along) rather than independent build-break-fix exercises. Full standalone labs from the 7.5–8hr version can be issued as optional take-home extensions – see note at the bottom.

**Morning Block (9:00 AM –
12:00 PM, 3 hrs)**

Time	Segment	Notes
9:00– 9:10	Opening & framing	Trimmed from 15 to 10 min – skip the six-layer preview, just state the day's arc
9:10– 9:40	Part 1: OpenClaw – orchestration	Demo only, no independent build
9:40– 10:10	Part 2: Hermes – model layer	Keep the tool-calling comparison; drop deep hands-on, show one worked example
10:10– 10:35	Part 3: NanoClaw – edge layer	Demo the deployment; skip live trade-off debate, cover as slide
10:35– 10:45	Break	
10:45– 11:15	Part 4: Heartbeat	Concept (4.1) + OpenClaw

Time	Segment	Notes
	Mechanisms	mechanics (4.2) as lecture; fold edge case (4.3) into 1–2 slides; replace 15-min lab with a 5-min live demo of kill-and-detect
11:15–11:45	Part 5: Skill Writing	Anatomy (5.1) + discoverability (5.2) with the bad/good example; security (5.3) as a 5-min callout; skip independent lab, do one instructor-led register-and-invoke demo
11:45–12:00	Part 6 intro: Channel Integration	Cover messaging (6.1) only — Telegram/WhatsApp webhook flow; save voice for after lunch

Lunch (12:00 PM – 1:00 PM, 1 hr)

Afternoon Block (1:00 PM – 2:30 PM, 1.5 hrs)

Time	Segment	Notes
1:00–1:20	Part 6 continued: Voice + channel abstraction	Cover 6.2 (voice patterns, latency budget) and 6.3 (abstraction layer) at lecture pace; drop independent lab, show the messaging demo's voice equivalent as a walkthrough only
1:20–1:40	Part 7: A2A Setup	Cover 7.1 (why not off-the-shelf) and 7.2 (protocol anatomy) fully; compress 7.3

Time	Segment	Notes
		(heartbeat+skill integration into routing) into a single diagram; skip the independent lab
1:40–2:05	Combined lab (single run-through)	One instructor-led end-to-end demo: channel message → A2A routing → healthy NanoClaw agent → skill invocation → reply. Learners observe and annotate rather than build in parallel
2:05–2:20	Discussion	Condensed version of the original wrap-up discussion prompts — pick 2, not all
2:20–2:30	Wrap-up & Q&A	

What Got Cut (and how to recover it)

- **Independent hands-on labs** in Parts 4, 5, 6, and 7 are replaced with instructor-led demos. If you want learners actually building, this schedule needs either a second day or a pre-work assignment.
 - **Edge-case deep dives** (NanoClaw connectivity trade-offs in 4.3, security sandboxing detail in 5.3) are compressed to slides/callouts rather than discussed live.
 - **Suggested recovery path:** issue the four independent labs (heartbeat producer/consumer, skill critique-and-rewrite, channel wiring, A2A message envelope) as a take-home exercise set, then use a follow-up 1-hour session purely for lab review and the combined end-to-end walkthrough in more depth.
-

Materials Checklist (unchanged from full version)

- Redis instance (local or shared)
- NanoClaw device or Pi-class emulation environment
- Hermes model weights (quantized build)
- Starter OpenClaw agent scaffold with Redis Streams + MCP pre-wired
- Set of 3–4 weak skill descriptions (for the demo, not independent critique)
- Telegram and/or WhatsApp sandbox/test account with webhook access
- Basic ASR/TTS setup for the voice walkthrough
